Is Epi proColon® Right for You?

Epi pro Colon is the FIRST and ONLY FDA approved blood test for colorectal cancer screening for average-risk persons, age 50 and older who are unwilling or unable to be screened by other recommended methods (imaging and/or stools tests).

To determine if Epi proColon is right for you, discuss the following with your doctor:

___ yes  ___ no   Are you considered average risk for colorectal cancer?
___ yes  ___ no   Have you avoided colorectal cancer screening?

Epi proColon detects as many cancers as FIT with the convenience of a blood test

What is the science behind Epi proColon?

• Epi proColon detects methylated Septin 9 DNA that has been shed into the bloodstream from throughout the colon and rectum.¹
• Methylation of the SEPT9 gene is increased in colorectal cancer.¹

Where do my patients get tested?

A routine blood draw can be performed in your office or at a participating regional or national clinical laboratory (LabCorp, ARUP) as designated by the patient’s healthcare plan.

How do I interpret the Epi proColon Result?

If Epi proColon is positive, refer your patient for a diagnostic colonoscopy.
If Epi proColon is negative, discuss a future screening plan that is right for your patient.
